User's Guide

TEW-455AP80

Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

IMPORTANT NOTE:

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. End users must follow the specific operating instructions for satisfying RF exposure compliance.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

This device complies with the essential requirements of the R&TTE Directive 1999/5/EC. The following test methods have been applied in order to prove presumption of conformity with the essential requirements of the R&TTE Directive 1999/5/EC:

- EN60950-1:2001 A11:2004
Safety of Information Technology Equipment
- EN50385 : (2002-08)
- Product standard to demonstrate the compliance of radio base stations and fixed terminal stations for wireless telecommunication systems with the basic restrictions or the reference levels related to human exposure to radio frequency electromagnetic fields (110MHz - 40 GHz) - General public
- EN 300 328 V1.7.1: (2006-10)
- Electromagnetic compatibility and Radio spectrum Matters (ERM); Wideband Transmission systems; Data transmission equipment operating in the 2,4 GHz ISM band and using spread spectrum modulation techniques; Harmonized EN covering essential requirements under article 3.2 of the R&TTE Directive
EN 301 489-1 V1.7.1: (2006-07)

Electromagnetic compatibility and Radio Spectrum Matters (ERM); ElectroMagnetic Compatibility (EMC) standard for radio equipment and services; Part 1: Common technical requirements
- EN 301 489-17 V1.2.1 (2002-08)
- Electromagnetic compatibility and Radio spectrum Matters (ERM); ElectroMagnetic Compatibility (EMC) standard for radio equipment and services; Part 17: Specific conditions for 2,4 GHz wideband transmission systems and 5 GHz high performance RLAN equipment

This device is a 2.4 GHz wideband transmission system (transceiver), intended for use in all EU member states and EFTA countries, except in France and Italy where restrictive use applies.

In Italy the end-user should apply for a license at the national spectrum authorities in order to obtain authorization to use the device for setting up outdoor radio links and/or for supplying public access to telecommunications and/or network services.

This device may not be used for setting up outdoor radio links in France and in some areas the RF output power may be limited to 10 mW EIRP in the frequency range of 2454 – 2483.5 MHz. For detailed information the end-user should contact the national spectrum authority in France.

1 INTRODUCTION

The Product

The product is based on the IEEE 802.11b/g standard, which is the latest 54Mbps Wireless LAN (WLAN) standard. Having this wireless protocols in one product ensure that your investments are protected, while enabling you to enjoy the fastest Wireless LAN speed.

This product model – TEW-455APBO could operate either as a Wireless LAN Access Point or Ethernet Bridge mode.

Key Features

- Fully compatibility with IEEE 802.11b/g WLAN standard
- Utilize OFDM (Orthogonal Frequency Division Multiplexing)
- Wireless data rate of up to 108Mbps.
- Operates in the 2.4GHz license-free frequency band
- Industrial grade IP66 Casing
- Power over UTP cable DC supply
- **WEP** (Wired Equivalent Privacy). A simple WLAN encryption standard to protect wireless data from sniffers.
- **WPA** (WiFi Protected Access), for AP mode only. An improved WLAN encryption standard where the secret key renew automatically at regular intervals.
 - ▶ **TKIP** (Temporal Key Integrity Protocol). A new encryption key will be generated by corporate RADIUS server when a authorized wireless adaptor/user associate with the Access Point. This encryption key renew automatically at regular intervals. This is normally used in high security enterprise networks.
 - ▶ **Pre Shared Key (WPA-PSK)**. A new key is generated each time a wireless adaptor connects to the Access Point. This normally used for home user without a RADIUS server.
- **Remote AP list** provides added security for AP mode.
- **Protocol Filters** provides security to the network
 - ▶ **IPX Filter**
 - ▶ **Wireless Isolation**. Each wireless user would not be able to see each other even though they are in the same subnet. This is to protect the privacy of each user.
 - ▶ **Broadcast Filter**
 - ▶ **Multicast Filter**
- User-friendly web-based interface for managing and configuring the Access Point.
- QoS features for multimedia support - voice, video and audio.

2 PACKAGE CONTENTS

Content of Package

- TEW-455APBO
- 48VDC Combiner adaptor (PoE)
- Screw, Washers and U-bolts
- Mounting brackets (For walls or pole mount)
- Grounding wire
- RJ45 water-proof plastic plug
- CD-ROM (Utility & User's Guide)
- Multi-language quick installation guide

Note: Standard package may vary with model type and country. Using a combiner adaptor with a power rating other than the one included in the package will cause serious damage to the Access Point and void the warranty for this product.

System Requirements for Configuration

- Computers with Windows, Macintosh or Linux-based operating systems and with an Ethernet adaptor
- Internet Explorer version 5.5 and above or Netscape Navigator that supports Java

3 CONNECTION (HARDWARE)

Front/ Interface View

The figure below shows the LED Indicator of the Wireless LAN Access Point.

POWER (PWR):

This indicator lights **green** when the Access Point receives power. Otherwise, it turns off.

WLAN:

The indicator blinking **blue** whiles the wireless LAN activity.

Rear/ Side view

The figure below shows the rear panel of the Access Point

The 4 holes at the rear of the Outdoor AP are designed for mounting brackets installation, which included within every package.

PoE

The PoE is to get power source over Ethernet connection, please unscrew the dust cap of the PoE outlet and plug your PoE power injector into position.

Remove the dust cap

EXT

The EXT outlet allows connecting to higher gain external antenna based on specific requirements.

Unscrew the dust cap from the EXT outlet, and then you have to connect the cable to the EXT connector.

About EXT connector:

The EXT connector is designed with mechanical switch function that allows upgrading to higher gain external antenna for better transmission performance.

WARNING:

Please do screw the cable male connector tightly to the EXT female connector, with this action, the mechanical switch will automatically disable the built-in 9dBi directional antenna and the RF signal will be guided to the chosen external antenna.

□ To complete installation between the Outdoor AP and TRENDnet external antenna series, an additional accessory is required and has to be purchased separately like other external antennas, please contact your local reseller or distributor for further product information

TEW-ASAL1, the extension cable with built-in surge protector

Recommend to connect the shorter side of the cable to the Outdoor AP and the longer side of the cable to the external antenna.

Once the EXT connector is screwed with extension cable and it will automatically transfer your RF signal from the built-in antenna to the chosen external antenna through the connected cable. Please do the signal alignment from the external antenna instead of the device side.

RESET

The Reset function is to reset the setting back to factory default setting.

Unscrew the dust cap from RESET button, and you can see a rod inside the Reset button; try to push the rod and the rod inside until the feel of the touch to the reset button

System Restart: Pressing the reset button for 5 seconds and release will perform a system reboot.

Factory Reset: Disconnect the PoE cable (power), press and hold the reset button for 5 seconds, plug in the PoE cable (power), continue to hold the reset button for 10 seconds before releasing. The unit will reset all configurations to factory default settings.

VENT

GORE Membrane Vent are used to enhance the ingress protection (IP) of gasketed enclosures

Grounding

The enclosed grounding wire allows you to connect to grounding location near your devices; this would help to protect your outdoor devices from damages caused by unexpected lightning effects.

4 BASIC IP NETWORKING

IP = Internet Protocol

IP stands for Internet Protocol. In an IP network, every device has a **unique** IP Address (For example: 192.168.10.35) to identify itself. There are two ways of assigning an IP address to a PC or Router: Static and Automatic (DHCP). Static IP addresses are keyed-in manually, while Dynamic IP's are distributed by a DHCP Server.

Ports

Every packet of traffic is identified by its Source and Destination Addresses, which would ensure that the packet arrives at the correct destination. A Port Number is also embedded in each packet; to identify which software application that generated and uses that packet. Therefore, if it blocks a certain port number, it denies the particular software from using the connection.

Static IP Address

Static IP addressing ensures that the device will always have the same IP address. Static addressing is commonly used for your servers.

Dynamic IP Address

A dynamic IP address is one that is automatically assigned to a PC. These IP addresses are “dynamic” because they are only temporarily leased to the PC when it connects to the network. This is the most convenient and common way of managing IP addresses in a network. The Server that manages this pool of IP addresses is called the DHCP Server. The product has a DHCP Server built-in to simplify the network management.

DHCP (Dynamic Host Configuration Protocol)

The PC obtaining an IP address from the Server is called the DHCP Client. If there is already a DHCP Server running on your network, you must disable one of the two DHCP servers. Running more than one DHCP server together will cause network problems!

Wireless LAN Basics

A Wireless LAN (WLAN) is a computer network that transmits and receives data with radio signals instead of using cables. WLAN has become common in homes, offices, airports and public Hotspots. WLAN can support the same applications and software that run on a wired network (LAN). Besides supporting the same software and functions, WLAN brings greater convenience and eliminates the need to lay Ethernet cables in a home or office.

The AP can even support 108Mbps wireless data rate at Turbo mode. This is only applicable for user using recommended Turbo-capable Cardbus (with Atheros chipset).

WLAN networking involves a few additional parameters to be configured:

SSID

The SSID is the “network name” for the WLAN network. The SSID is any name, and can be any set of characters or numbers. The Client sniffs the radio frequencies for an AP with the same SSID with itself. The client locks onto the AP and they are “associated”.

To enable plug-and-play convenience, most client cards can sniff the frequencies to extract the available SSID’s to let the user choose from.

Encryption

WLAN traffic can be captured by anybody to be read! The solution is to use encryption to make the traffic appear as random characters to the eavesdropper. Both the AP and client must use the same encryption standard and key to enable them to decode the “rubbish”. If the encryption settings are mismatched, the client and AP cannot associate. WEP (Wired Equivalent Privacy) is the most common WLAN encryption standard.

Channel

There are a total of 13 channels in the 2.4GHz band. Depending on regulation, not all the frequencies may be available in every country. Frequency is configured on the AP only. The client searches for the AP and locks onto that AP’s channel.

Signal Strength

Radio signals drop in power over a distance. Even if all the settings are correct, low signal strength makes association impossible. The usable distance between the AP and client can range from a few meters indoor to a few km. When setting up the client, make sure that you:

- Keep at a distance between the AP and the clients.
- Make sure that the WLAN signals do not have to pass through too many concrete walls and metal structures to reach the client.
- Make sure that clients are located far away from one another to avoid interference.
- Make sure that there is line of sight between the AP and client device.

Interference

Interference happens when 2 clients with the same channels are placed near to one another. The speed of the network drops and the signal strength fluctuates wildly.

Roaming

Association happens when the SSID, Encryption and MAC Address Control settings are correct between the AP and client. If 2 AP's with these same settings are located in the same area, the client would choose to associate to the one which gives it a better signal strength. The client would roam over to the 2nd AP when he moves nearer to it. The client switches AP and frequency as he does so.

5 GETTING STARTED

Connect the network as shown previously.

If your PC is **wireless**, check the PC's card utility to make sure that the signal strength is good and that the bottom LED lights up on the AP.

Open a Web browser (Internet Explorer, Netscape etc.).

Type the AP LAN IP (**192.168.10.100**) address into the browser's Address field. The default LAN IP address is 192.168.10.100.

6 CONFIGURATION MENU

In every Web Configuration page, the left panel is the navigation menu containing the main sections. The right-side frame is where the detailed configuration is done.

Navigation Panel

- Site Survey
- Administration
- IP Configuration
- Operation Mode

Advanced

Status

IP Configuration

Reboot AP

IP Mode: Static IP Dynamic IP (DHCP Client)

IP Address: 192 . 168 . 10 . 100

Subnet Mask: 255 . 255 . 255 . 0

Default Gateway Address: 0 . 0 . 0 . 0

Apply

Basic → Site Survey

Refresh

Index	SSID	BSSID	Radio Mode	Channel	Signal Strength	Security Mode
-------	------	-------	------------	---------	-----------------	---------------

Site Survey: Displays the MAC address, RSSI, SSID and the channel of other AP.

Basic → Administration

This page allows you to change the Username and Password for admin user/end user. The default username is admin and password is admin. After every factory reset, the Username and Password reverts to this combination. To view/upgrade firmware version, you need to close this configuration page. Then you have to login as a super user/system administrator in the configuration page again. The default username is super and password is super. After every factory reset, the Username and Password reverts to this combination. Refer to super user instructions for more info.

Device Name:

User Name:

Password:

The username and password are case sensitive.

Remember that after every configurations changed, it is necessary to update and reboot the AP for changes to take effect.

Basic → IP Configuration

This page allows you to choose the type of IP

IP Mode:	Static IP <input checked="" type="radio"/> Dynamic IP (DHCP Client) <input type="radio"/>
IP Address:	192 . 168 . 10 . 100
Subnet Mask:	255 . 255 . 255 . 0
Default Gateway Address:	0 . 0 . 0 . 0

Static IP mode: When you boot up the AP for the first time, it is in Static mode. You assign a Static IP to the AP. The default IP address, subnet mask and gateway mask are 192.168.10.100, 255.255.255.0 and 0.0.0.0.

DHCP mode: the AP will obtain an IP Address from an upstream DHCP Server.

When in DHCP client mode, these 4 columns show the IP settings obtained from the network.

Basic → Operation Mode

Operation Mode	
Operation Mode:	<input checked="" type="radio"/> Access Point <input type="radio"/> Wireless Repeater <input type="radio"/> Ethernet Bridge
SSID:	TRENDnet <input type="checkbox"/> Suppress SSID
Wireless Mode:	2.4GHz 54Mbps (802.11g)
Radio Frequency:	SmartSelect
WDS:	<input checked="" type="radio"/> Enable <input type="radio"/> Disable <input type="radio"/> Disable (Multiple PCs Support)
Advanced Settings:	
Antenna Settings	Distance: 4-6 Km <small>Note: For directional antennas, please adjust the antenna for better performance.</small> <input type="button" value="Adjust Antenna"/>
Remote AP MAC List:	Remote AP MAC 1: 00:00:00:00:00:00

Operation Mode: TEW-455APBOperates as Wireless LAN Access Point, Wireless Repeater or Ethernet Bridge mode.

Wireless Bridge is used when it is not advisable to lay an Ethernet line over a distance. Two AP's can be set up to connect over this distance, acting as the wired backbone.

SSID: Service Set Identifier. It is a sequence of characters that uniquely names a Wireless LAN. This name allows PCs to connect to the correct Wireless Access Point when multiple Access Points operate in the same location. The default SSID is **11g**.

Wireless Mode: The AP or Bridge operates in the frequency of 2.4GHz for 802.11g.

Radio Frequency: There are different frequency channels depending on the country of use. You can choose to set the frequency channel to use or use SmartSelect for automatic channel selection.

WDS: Enable or disable or disable with multiple PC support. When WDS enabled, all PC connected to bridge/AP can communicate with each other. When the WDS is disabled, only PC connected to the bridge/AP can communicate with each other. When disabled with multiple PC support, all PC connected to bridge/AP can communicate with each other, even if the AP cannot support WDS.

Advance Settings: This is to set the distance for bridging. The default distance is 4-6km.

Remote AP MAC List: The Bridge will only associate with AP whose MAC address is in the list. It is essential to type in the MAC address of the AP without any spacing in front or behind it.

Antenna replacement: The unit is embedded with 9dBi directional antenna, if you need further distance or other application, please contact your local distributor for TRENDnet high gain antenna series.

1. Make sure you are browsing this page through an **directly connected Ethernet** wire.
2. Please adjust the antenna until you achieve minimum of **Good** signal quality
3. For **client mode** pls **generate some traffic** between AP and Bridge, Eg: For bridge with IP "192.168.1.33", run "**ping 192.168.1.33 -t -l 10000**" at command prompt

ID	MAC Address	Signal Quality
1	00:06:C7:01:00:4F	Average(22)
2	00:06:C7:14:07:BC	Excellent(46)

This page shows the MAC Address and Signal Quality of the units associated to the AP. For long distance bridging, make sure that you get at least a "good" signal quality for desired performance.

Do not insert any spacing in front or behind the MAC address when using Remote AP MAC List. Failing to do so will cause the bridge unable to associate with the intended AP.

Advanced → Radio Setting

The screenshot shows the Trendnet web interface for the 9dBi High Power Outdoor PoE Access Point TEW-455APB0. The interface is divided into a left sidebar with navigation tabs (Basic, Advanced, Status) and a main configuration area. The 'Advanced' tab is selected, and the 'Radio Setting' sub-tab is active. The configuration area contains a table of settings with the following values:

Data Rate:	best
Transmit Power:	Half (50%)
Beacon Interval:	100 (20 - 1000)
Data Beacon Rate (DTIM):	1 (1 - 255)
RTS/CTS Threshold:	500 (0 - 2347)
Short Preamble:	<input type="radio"/> Disable <input checked="" type="radio"/> Enable
Protection Mode:	Auto
Protection Rate:	11 Mbps
Protection Type:	<input checked="" type="radio"/> CTS-only <input type="radio"/> RTS-CTS
Short Slot Time:	<input type="radio"/> Disable <input checked="" type="radio"/> Enable
Allow 2.4GHz 54Mbps Stations Only:	<input checked="" type="radio"/> Disable <input type="radio"/> Enable

Buttons for 'Reboot AP' and 'Apply' are visible. The footer of the interface reads 'Copyright © 2007 TRENDnet. All Rights Reserved.'

Data Rate: You can fix the data rate to different values as 11Mbps or 24Mbps. However it is recommended to set the setting to “Best” for the AP to determine the best data rate to be use.

Transmit Power: Sometimes, it is useful to decrease the coverage range of each AP, so that more AP’s can be located together without interference to one another. The default transmission power is 100%.

Beacon Interval: Choose between 20 and 1000. Low Beacon Interval will make the association and roaming process very responsive. However, throughput will decrease, so it is necessary to strike a balance. Typical Beacon Interval is set to 100ms.

Data Beacon Rate (DTIM): Choose between 1 to 255. This is always a multiple of the beacon interval. It determines how often the beacon contains a delivery traffic indication message (DTIM). The DTIM tells power-save client devices that a packet is waiting for them.

RTS/CTS Threshold: Enter a value between 0 and 2347.

Short Preamble: Enable to use Short Preamble in the Wireless LAN packet headers. Most manufacturers implement long preambles. Even if there is a mismatch between AP and the client, they can still connect well and the mismatch may not be noticeable to most users. Do not change this setting without seeking advice.

Protection Mode: Select None, Always or Auto.

Protection Rate: Select 1Mbps, 2Mbps, 5.5Mbps or 11Mbps.

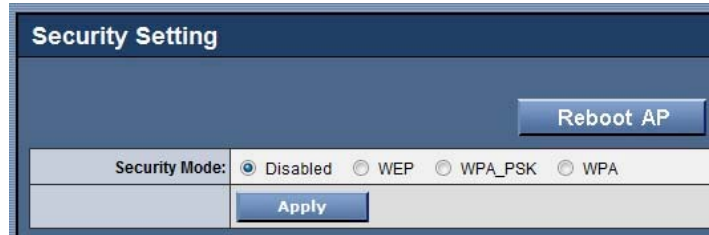

Protection Type: Select either CTS only or RTS-CTS.

Short Slot Time: Enable or disable short time slot usage.

Allow 2.4GHz 54Mbps Stations Only: Use this radio button to enable or disable the association of 2.4 GHz 54 Mbps STA only.

Advanced → Security Setting

This section allows you to configure wireless encryption to prevent unwelcome parties from reading your traffic. Authentication can also be configured to block outsiders from accessing your network.

The screenshot shows the 'Security Setting' window. At the top right is a 'Reboot AP' button. Below it, the 'Security Mode:' section has four radio buttons: 'Disabled' (selected), 'WEP', 'WPA_PSK', and 'WPA'. An 'Apply' button is located at the bottom center.

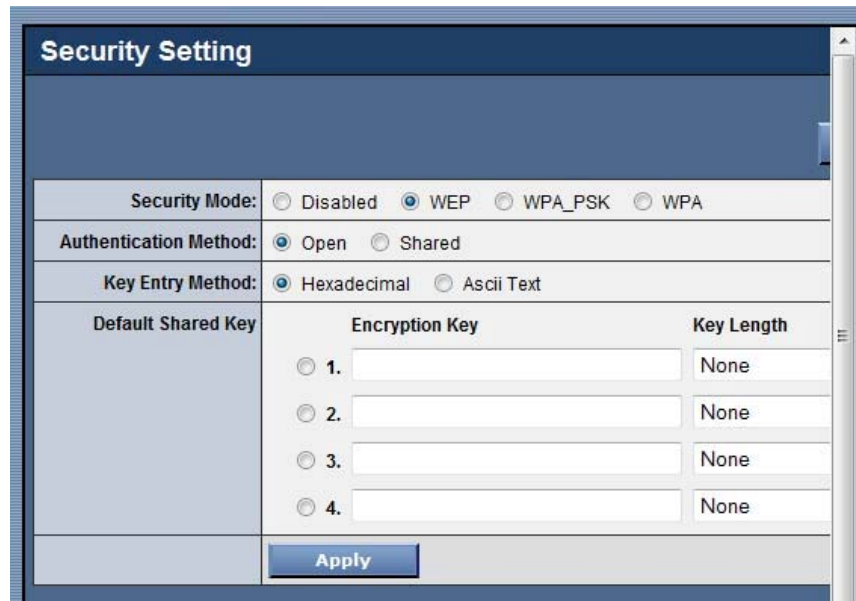

Disable: No wireless security.

WEP: Select to apply WEP security.

WPA-PSK: Select to apply WPA-PSK security.

WPA: Select to apply WPA security.

WEP Security

The screenshot shows the 'Security Setting' window with 'WEP' selected. The 'Authentication Method:' section has 'Open' (selected) and 'Shared' radio buttons. The 'Key Entry Method:' section has 'Hexadecimal' (selected) and 'Ascii Text' radio buttons. Below this is a table for 'Default Shared Key' with columns for 'Encryption Key' and 'Key Length'. There are four rows, each with a radio button (1-4), a text input field, and a 'Key Length' dropdown menu. An 'Apply' button is at the bottom.

Default Shared Key	Encryption Key	Key Length
<input type="radio"/> 1.	<input type="text"/>	None
<input type="radio"/> 2.	<input type="text"/>	None
<input type="radio"/> 3.	<input type="text"/>	None
<input type="radio"/> 4.	<input type="text"/>	None

Key Entry Method: Choose Hexadecimal if you want to enter the Keys in hexadecimal format. Otherwise, choose ASCII Text to enter the Key in ASCII format. ASCII is also called Alphanumeric in some systems. Use the same key format for the AP and Client!

Encryption Key: Enter the encryption key.

Key Length: Choose the number of bit for the encryption key.

The screenshot shows a dropdown menu for 'Key Length'. The options are: 'None', 'None', '64 bit (10 hex digits/ 5 ascii keys)', '128 bit (26 hex digits/13 ascii keys)', and '152 bit (32 hex digits/16 ascii keys)'. The '152 bit' option is highlighted.

	<p>Hexadecimal Characters: 0,1,2,3,4,5,6,7,8,9 and a,b,c,d,e,f</p> <p>ASCII Characters: 0,1,2,.....8,9 and a,b,c,d,.....x,y,z</p>
---	---

WPA-PSK Security

Security Mode: Disabled WEP WPA_PSK WPA

PassPhrase:

Cipher Type:

- TKIP
- AES

PassPhrase: Key in the 8-64 character for PSK.

Cipher Type: Choose Auto, TKIP or AES.

WPA Security

Security Mode: Disabled WEP WPA_PSK WPA

RADIUS Server IP:

RADIUS Server Port:

RADIUS Secret:

Key Update Interval:

Cipher Type:

5GHz Key Source: Local Remote

RADIUS Server IP: Enter the IP Address of the RADIUS Server (for 802.1x authentication purposes). This is used only when you have a RADIUS Server and want to use it for authenticating the Wireless Clients. Almost all homes and many offices do not have a RADIUS Server. These settings are for advanced users only.

RADIUS Port: Enter the port number of the RADIUS Server.

RADIUS Secret: Enter the Shared Secret of the RADIUS Server. (Only if 802.1x protocol is used)

Key Update Interval: Specify the interval in milliseconds. The default is 1800.

Cipher Type: Choose Auto, TKIP or AES.

2.4GHz Key Source: Specify the location of the key storage. (Only if 802.1x is used.) If you are using PSK or Pre-shared key, select local.

Advanced →MAC Address Control

This is only use when the AP is operating in the AP mode.

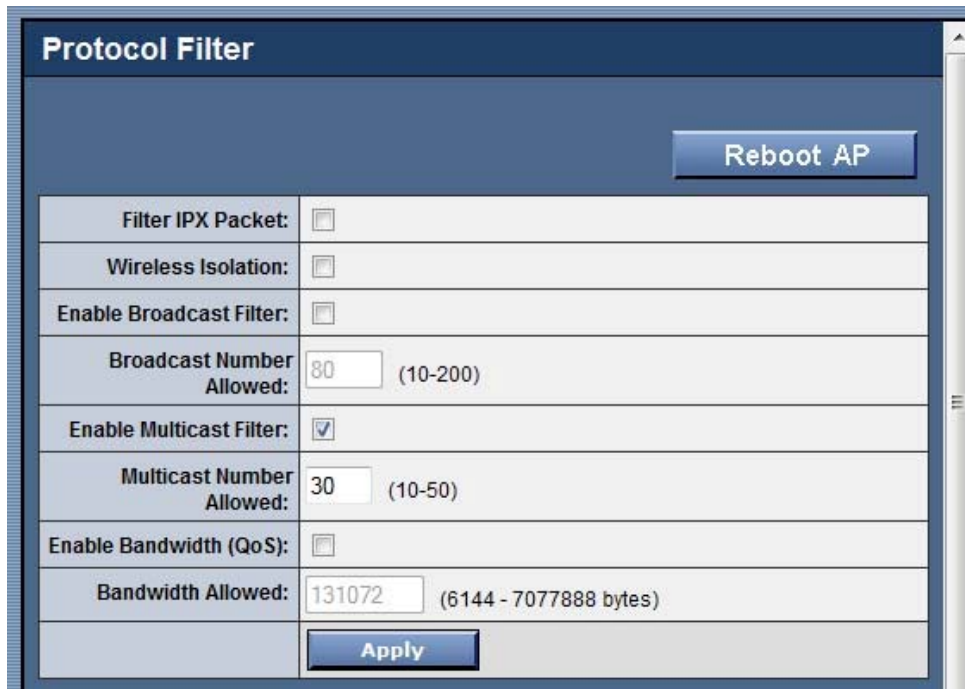

MAC Address Control	
MAC Address Control:	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
	<input type="button" value="Apply"/>
MAC Address:	<input type="text" value="00:00:00:00:00:00"/> <input type="button" value="Add"/>

MAC Address Control: Enable or Disable MAC addresses Control.

MAC Address: Enter the MAC address of the client.

Allowed MAC Address List: Reflects the MAC addresses of the clients that are allowed to associate with the AP.

Advanced →Protocol Filter

Protocol Filter	
Filter IPX Packet:	<input type="checkbox"/>
Wireless Isolation:	<input type="checkbox"/>
Enable Broadcast Filter:	<input type="checkbox"/>
Broadcast Number Allowed:	<input type="text" value="80"/> (10-200)
Enable Multicast Filter:	<input checked="" type="checkbox"/>
Multicast Number Allowed:	<input type="text" value="30"/> (10-50)
Enable Bandwidth (QoS):	<input type="checkbox"/>
Bandwidth Allowed:	<input type="text" value="131072"/> (6144 - 7077888 bytes)
	<input type="button" value="Apply"/>

Filter IPX Packet: Selecting this option will disallow all IPX packets to pass through.

Wireless Isolation: Selecting this option will disallow wireless clients associated with this device to communicate with each other.

Enable Broadcast Filter: Selecting this option will filter off out broadcast storm.

Broadcast Number Allowed: Select a number in between 10 to 200.

Enable Multicast Filter: Selecting this option will filter off out multicast storm.

Multicast Number Allowed: Select a number in between 10 to 50.

Enable Bandwidth (QoS): Selecting this option will limit the bandwidth on TCP/IP data based on the number entered in the textbox.

Bandwidth Allowed: Select a number in between 6144 to 7077888 bytes.

Advanced →SNMP Configuration

SNMP Configuration	
Enable SNMP:	<input checked="" type="checkbox"/>
Read Community String:	public
Write Community String:	netman
System Contact:	
System Location:	
<input type="button" value="Apply"/>	

Enable SNMP: Selecting this option will enable the SNMP feature.

Read Community String: The SNMP Client with this “passphrase” will have “Read” access.

Write Community String: The SNMP Client with this “passphrase” will have “Write” access.

System Contact: To set the MIB2 sysContact OID value.

System Location: To set the MIB2 sysLocation OID value.

Miscellaneous	
	Reboot AP
Enable Telnet:	<input checked="" type="checkbox"/>
Save Configuration to Local Device:	Save
Restore Configuration from Local Device:	Restore & Reboot
Revert to factory setting:	Factory Reboot
	Apply
Save Configuration to Local PC:	Save
Restore Configuration from Local PC:	<input type="text"/> Browse... Restore

Enable Telnet: Disable/enable Telnet access to this device.

Save configuration to local device: After you have successfully configured the AP, you can save this “Good Config” into device memory.

Restore configuration from local device: To retrieve previous “Good Config” to restore the AP back to the working setting that was previously saved.

Revert to factory setting: If you have even forgotten the password to get into the configuration pages, you would have to do a Factory Reset to the AP.

Save configuration to local PC: After successfully configured the AP, save this “Good Config” into the computer system.

Configuration file on local PC: Browse to the location of the saved “Good Config” in the computer system.

Restore configuration from local PC: Allow restoring back to the “Good Config” from the computer system.

Status → System Status

This page presents a convenient overview of the overall status of the AP.

The most common configuration parameters are shown here, for a quick look.

System Status	
IP Mode:	Static IP Mode
IP Address:	192.168.10.100
Subnet Mask:	255.255.255.0
Gateway Address:	0.0.0.0
SSID:	TRENDnet
Wireless Mode:	11g
Radio Frequency:	2412 MHz (Channel 1)
Operation Mode:	Access Point
Security Method:	None
System MAC Address:	00:06:c7:01:29:19

Status → Association Status

This page presents an overview of the MAC address and Signal Strength of all clients connected to the AP through Ethernet or wireless. The signal strength is the Signal to Noise ratio (SNR) and it is measured in dBm.

Association Status						
ID	MAC Address	State	Signal Strength	Tx Num	Rx Num	Tx Rate

Status → Super User

This page allows you to change the Username and Password for admin user/end user. The default username is super and password is super. After every factory reset, the Username and Password reverts to this combination. The AP does not allow you to set the same Username for both admin and super users.

Super User	
	<input type="button" value="Reboot AP"/>
User Name:	<input type="text" value="super"/>
Password:	<input type="password" value="•••••"/>
	<input type="button" value="Apply"/>

Status → Firmware Upgrade

This page allows you to update the firmware (software) in the AP. New firmware are issued to improve the performance and add features to the product.

The new firmware will be name “aping1”.

1. Save the file in your PC.

The screenshot shows a web interface titled "Firmware Upgrade". At the top right is a "Reboot AP" button. Below it is a red warning message: "Attention: (Improper actions will damage the system)". This is followed by a bulleted list of instructions: "Please upload the correct firmware", "Please DO NOT power off or disconnect during uploading", "Please DO NOT close the browser during uploading", "Please DO NOT navigate to a different location", and "Uploading may take over 30 seconds depending on the bandwidth". Below the list is a text input field with the label "Enter the file name you want to upload:" and a "Browse..." button. At the bottom is an "Upload" button.

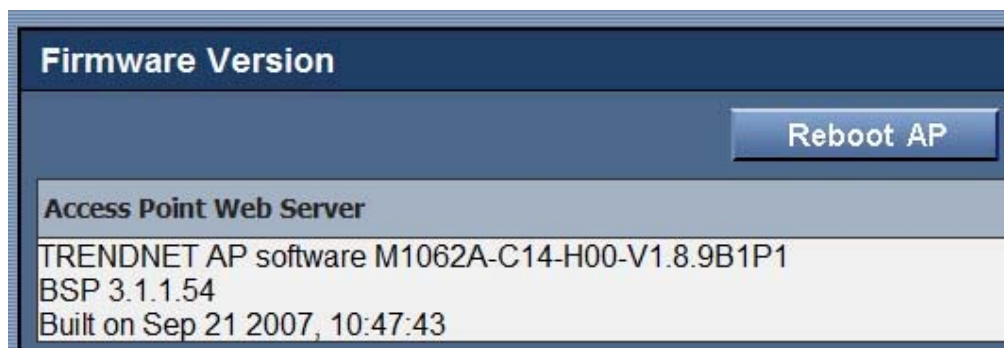

2. Browse to the file with the name “aping1”.
3. Click on **Upload**.
4. **Reboot** the AP and the process is complete.
5. After reboot perform a default factory setting.

Do not change the filename of the new firmware. New firmware with filename other than “aping1” will cause the process to fail.

Status → Firmware Version

This page presents information of the firmware version of the AP.

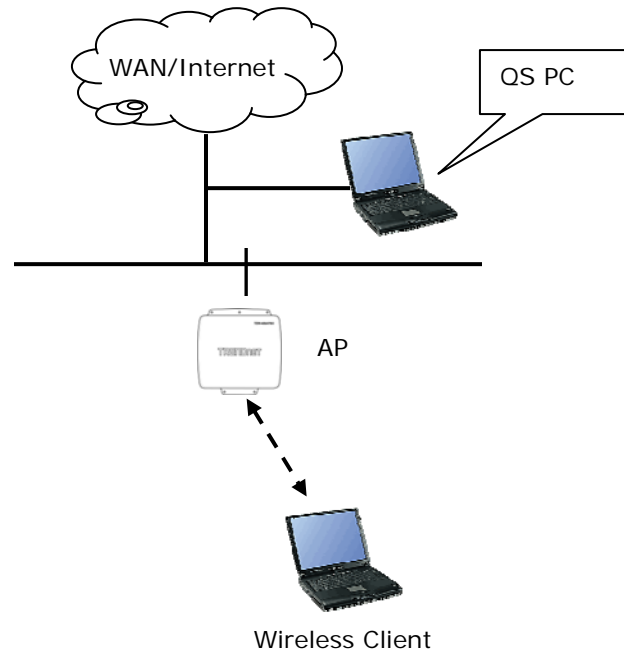

The screenshot shows a web interface titled "Firmware Version". At the top right is a "Reboot AP" button. Below it is a section titled "Access Point Web Server" containing the following text: "TRENDNET AP software M1062A-C14-H00-V1.8.9B1P1", "BSP 3.1.1.54", and "Built on Sep 21 2007, 10:47:43".

7 OUTDOOR AP UTILITY INSTALLATION

Introduction

The Outdoor AP utility is an easy-to-use software that allows an Administrator to quickly configure the AP at first boot-up. The QS Utility only communicates with authorized Access Points and Bridge. The Utility allows the devices to be monitored and configured even if they all have the same default IP Address at first boot-up after installation.

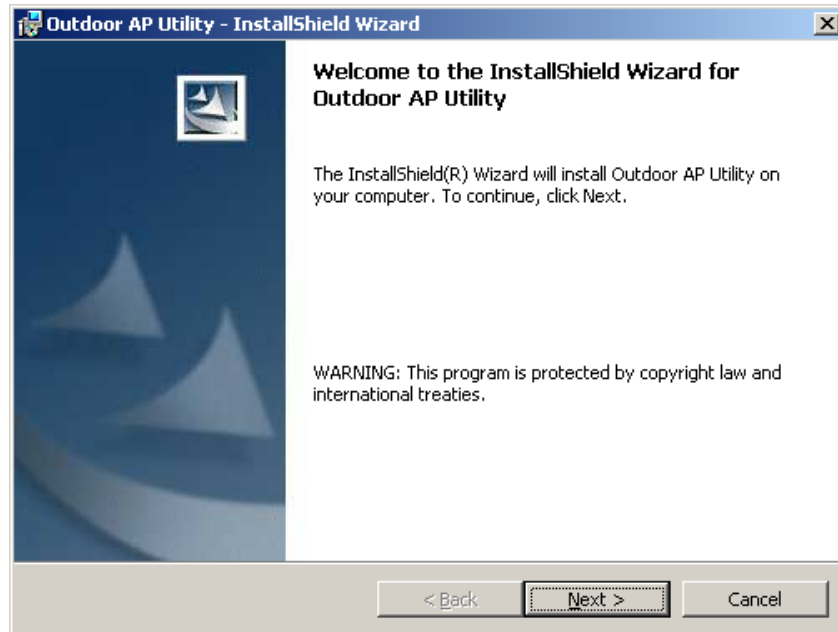

PC Requirement

- X86 based CPU, 600Mhz & above
- 128 MB RAM
- 1.5 MB hard disk space
- Ethernet port / Wireless LAN adapter
- Windows 2000 and above

Installation

Step one

Double click on the file *setup.exe* and click **Next** to continue.

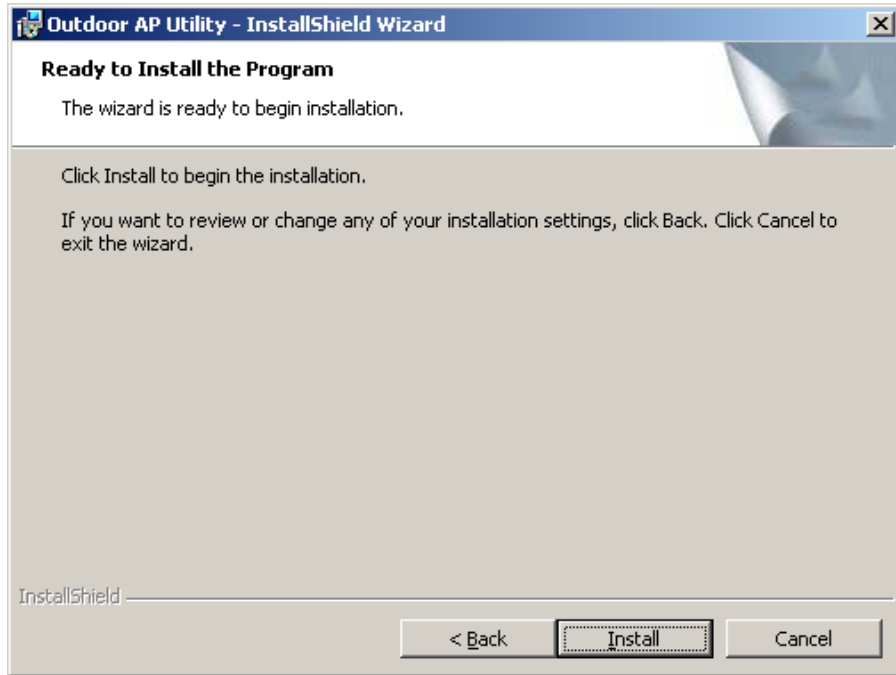

Step two

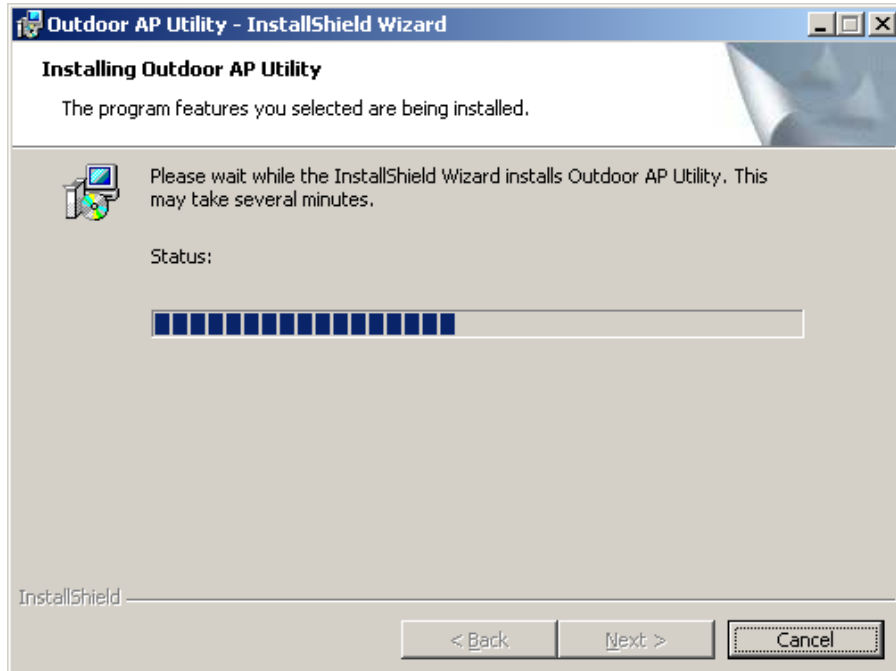

Click **Next** to accept the default installation directory. If you wish to change the installation directory, click on the **Change** button to select a new directory.

Step three

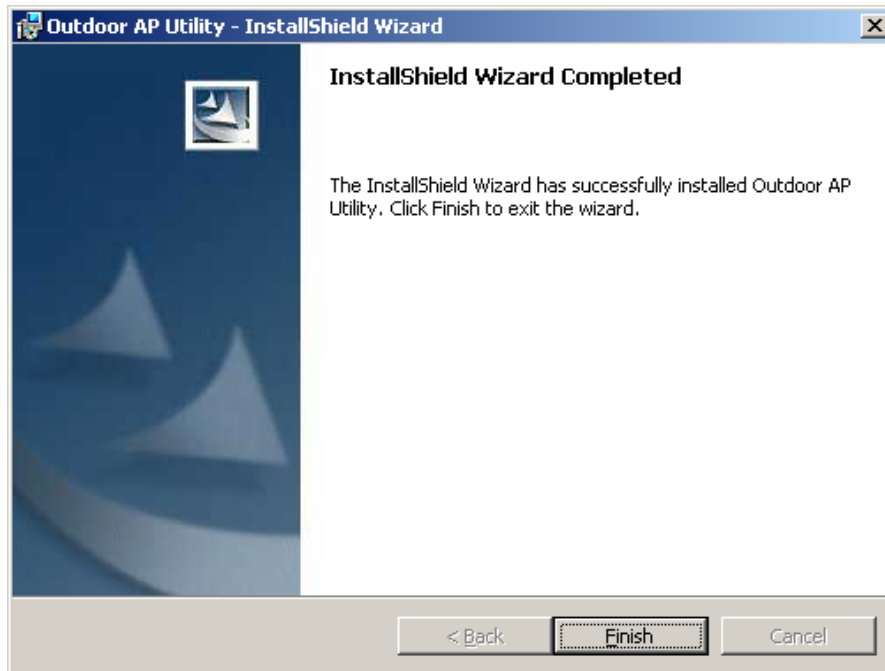

Click **Install** to do the actual installation

Step four

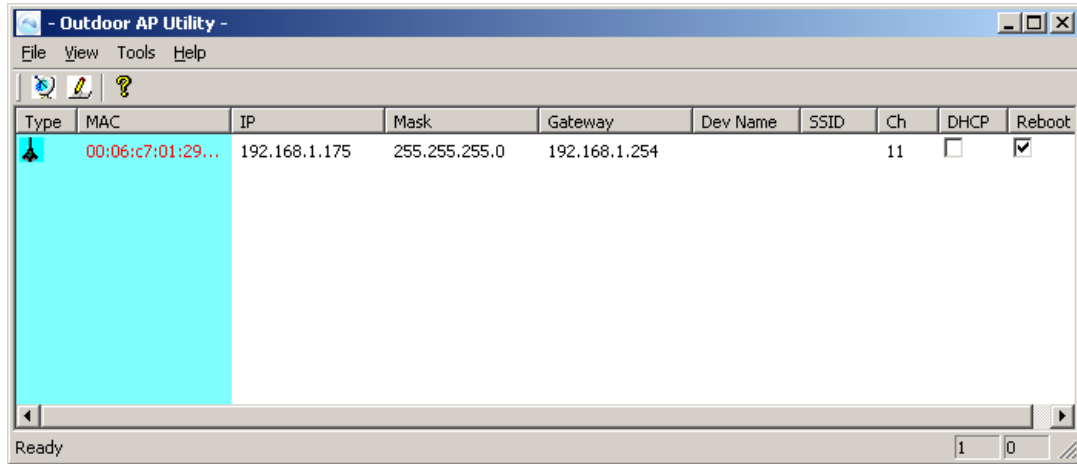

Click **Finish** to exit the installation wizard.

8 OUTDOOR AP UTILITY USER GUIDE

Outdoor AP Utility Icon

Click on the desktop icon **Outdoor AP Utility** to start the application.

Parameters Display in Utility

The Utility displays the following parameters that can be changed.

1. IP Address
2. Subnet Mask
3. Gateway
4. Device Name
5. Channel
6. DHCP/Static IP

Username and Password of Utility

If the username/password of the Devices have been changed, the QS Utility has to be updated with the correct username and password. If the username/password of the QS Utility and the Device is different, QS Utility will not operate as desired.

Making Changes

The changes are directly applied in the Utility.

IP	Mask	Gateway
10.0.0.160	255.255.255.0	10.0.0

Dev Name	Ch	DHCP
	8	<input type="checkbox"/>
	7	<input type="checkbox"/>
	8	<input type="checkbox"/>
	9	<input type="checkbox"/>
	10	<input type="checkbox"/>
	11	<input type="checkbox"/>

It does not matter if all the devices have the same IP Address. The QS Utility identifies them uniquely by their MAC Addresses.

Type	MAC
	00:06:c7:14:08:73

Updating Changes

After the necessary changes have been made, the Administrator can apply the changes to the AP. Check on the **Reboot** Checkbox and click on the **Update** button to reboot the device.

Multiple devices can be updated all at once. Use ctrl-left click to select multiple entries or type ctrl-A to select all entries. Click on Update button to begin the update process.

To refresh the view, use the **Find** button.

Pinging the Device

The QS Utility can also be used to ping a selected Device to check the connectivity.

Limited Warranty

TRENDnet warrants its products against defects in material and workmanship, under normal use and service, for the following lengths of time from the date of purchase.

TEW-455APBO	3 years
-------------	---------

If a product does not operate as warranted above during the applicable warranty period, TRENDnet shall, at its option and expense, repair the defective product or deliver to customer an equivalent product to replace the defective item. All products that are replaced will become the property of TRENDnet. Replacement products may be new or reconditioned.

TRENDnet shall not be responsible for any software, firmware, information, or memory data of customer contained in, stored on, or integrated with any products returned to TRENDnet pursuant to any warranty.

There are no user serviceable parts inside the product. Do not remove or attempt to service the product through any unauthorized service center. This warranty is voided if (i) the product has been modified or repaired by any unauthorized service center, (ii) the product was subject to accident, abuse, or improper use (iii) the product was subject to conditions more severe than those specified in the manual.

Warranty service may be obtained by contacting TRENDnet office within the applicable warranty period for a Return Material Authorization (RMA) number, accompanied by a copy of the dated proof of the purchase. Products returned to TRENDnet must be pre-authorized by TRENDnet with RMA number marked on the outside of the package, and sent prepaid, insured and packaged appropriately for safe shipment.

WARRANTIES EXCLUSIVE: IF THE TRENDNET PRODUCT DOES NOT OPERATE AS WARRANTED ABOVE, THE CUSTOMER'S SOLE REMEDY SHALL BE, AT TRENDNET'S OPTION, REPAIR OR REPLACEMENT. THE FOREGOING WARRANTIES AND REMEDIES ARE EXCLUSIVE AND ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, EITHER IN FACT OR BY OPERATION OF LAW, STATUTORY OR OTHERWISE, INCLUDING WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. TRENDNET NEITHER ASSUMES NOR AUTHORIZES ANY OTHER PERSON TO ASSUME FOR IT ANY OTHER LIABILITY IN CONNECTION WITH THE SALE, INSTALLATION, MAINTENANCE OR USE OF TRENDNET'S PRODUCTS.

TRENDNET SHALL NOT BE LIABLE UNDER THIS WARRANTY IF ITS TESTING AND EXAMINATION DISCLOSE THAT THE ALLEGED DEFECT IN THE PRODUCT DOES NOT EXIST OR WAS CAUSED BY CUSTOMER'S OR ANY THIRD PERSON'S MISUSE, NEGLIGENCE, IMPROPER INSTALLATION OR TESTING, UNAUTHORIZED ATTEMPTS TO REPAIR OR MODIFY, OR ANY OTHER CAUSE BEYOND THE RANGE OF THE INTENDED USE, OR BY ACCIDENT, FIRE, LIGHTNING, OR OTHER HAZARD.

LIMITATION OF LIABILITY: TO THE FULL EXTENT ALLOWED BY LAW TRENDNET ALSO EXCLUDES FOR ITSELF AND ITS SUPPLIERS ANY LIABILITY, WHETHER BASED IN CONTRACT OR TORT (INCLUDING NEGLIGENCE), FOR INCIDENTAL, CONSEQUENTIAL, INDIRECT, SPECIAL, OR PUNITIVE DAMAGES OF ANY KIND, OR FOR LOSS OF REVENUE OR PROFITS, LOSS OF BUSINESS, LOSS OF INFORMATION OR DATA, OR OTHER FINANCIAL LOSS ARISING OUT OF OR IN CONNECTION WITH THE SALE, INSTALLATION, MAINTENANCE, USE, PERFORMANCE, FAILURE, OR INTERRUPTION OF THE POSSIBILITY OF SUCH DAMAGES, AND LIMITS ITS LIABILITY TO REPAIR, REPLACEMENT, OR REFUND OF THE PURCHASE PRICE PAID, AT TRENDNET'S OPTION. THIS DISCLAIMER OF LIABILITY FOR DAMAGES WILL NOT BE AFFECTED IF ANY REMEDY PROVIDED HEREIN SHALL FAIL OF ITS ESSENTIAL PURPOSE.

Governing Law: This Limited Warranty shall be governed by the laws of the state of California.

Note: AC/DC Power Adapter, Cooling Fan, Cables and Power Supply carry 1-Year Warranty
